

## Parmenion Tech Test – Front End

### Question Responses

1. I spent a total of approximately 6hrs on the tech test.
2. Project setup and addition of a charting library went well, as did chart configuration.
3. I attempted to make the wide/narrow bands both reactive and to shade the relevant chart area. The former was impeded by the way I had initially built the application, and the latter by my lack of experience building that specific chart functionality.
4. In order to address the lack of band reactivity mentioned above, I would introduce a store API (e.g. Vuex, Redux). This would allow me to refactor the chartOptions configuration object to make it more composed, and thus permit two-way bindings at specific levels such as series data.
